

Congressional Catering:
**How Big Food and Agricultural Special Interests Wield Influence in Congress
and Undermine Public Health**

June 2015

Key Findings

A shocking one-half of the American population suffers from diet-related chronic disease and even more Americans are imperiled by medical risk factors for those diseases. Various editions of the Dietary Guidelines for Americans have been largely consistent in their advice for decades – emphasizing diets higher in fruits, vegetables and whole grains, and lower in added sugars, sodium, trans fat, and saturated fats.

Yet the American diet remains largely unchanged. The 2015 expert report by the Dietary Guidelines Advisory Committee (DGAC) indicates that a full one-third of our national diet is still comprised of burgers, sandwiches, pizza, dessert, sweet snacks, and sugary beverages.

Finally, progress to support Americans’ abilities to follow the Dietary Guidelines advice is underway:

- The 2015 DGAC, a 14-member committee of independent scientists convened by the Departments of Agriculture and Health and Human Services (“the Departments”) developed a robust set of public health recommendations grounded in science and published them for public comment in preparation for the Departments’ forthcoming 2015 Dietary Guidelines for Americans (DGA).
- The meals, snacks, and drinks sold in schools are improving as a result of updated standards based on the DGA and many companies have voluntarily agreed not to market foods to children that do not meet nutrition standards based on the DGA.
- In June 2015, the U.S. Food and Drug Administration (FDA) announced limits on partially hydrogenated oil (PHO), the main source of artery-clogging, industrial trans fat, as strong evidence demonstrates it is no longer generally recognized as safe.
- The FDA is moving forward – albeit slowly – on the development of *voluntary* guidance for sodium levels across many categories of foods.

Progress on critical public health and nutrition goals, however, is too often complicated by some politicians' clear willingness to run interference on behalf of the food industry. In the face of these limited steps forward, the food industry has mounted an intense defense, running to Congress to:

- Secure House Appropriations' riders on spending bills to ham-string the science on the DGA by imposing a far more stringent test for revisions to past advice than has ever been applied to recommendations before;
- Secure riders on spending measures to again delay efforts to reduce sodium in school lunches and breakfasts;
- In report language, threaten to restrict the FDA's ability to appropriately limit harmful trans fat in the food supply by delaying implementation of a determination that the artificial trans fat in partially hydrogenated oil is not generally recognized as safe; and
- In a committee report, threaten to bar the FDA from working to develop sodium guidance for the general public until it meets a series of arbitrary new requirements.

Each of these riders and threats is explained more fully in Appendix A, below.

It is essential that official government activities on diet and nutrition reflect up-to-date, science-based guidance without political interference. It is alarming that in the face of clear public health concerns – and regardless of the millions of Americans whose health is affected by government policies and advice – some Members of Congress would play politics with development of national nutrition policy. And it would set a new and dangerous precedent if eleventh-hour deals in Congress can derail the evidence-based advice of scientists or the informed work of the expert agencies on matters of public health.

Below we present a quick analysis of the influence of the food industry on current Members of Congress, including members of the Appropriations Committees in the House and Senate and signatories to the letters sent by members of both chambers earlier this year critical of the Dietary Guidelines. A few highlights:

Senate

- The 30 Senators (all of whom were Republican) who signed the March 12, 2015, letter critical of the DGAC report received more than a million dollars from the food industry between 2013 and 2014 – with approximately half of that sum given by the beef and cattle industry.
- Ninety-eight percent of contributions to Senate Appropriators – a sum of \$620,845 – went to Republicans (while a mere two percent – \$15,000 – was given to Democrats).

House

- The 71 House signers (again, all Republicans) of a letter criticizing the DGAC report received at least two million dollars from food and agricultural interests in 2013-2014.
- Eight-four percent of food and agriculture contributions to House Appropriators went to Republicans – a sum of at least \$685,942 (while only 16 percent, or \$142,650, went to Democrats).
- Only one Republican (Scott Rigel (R.-VA)) on the House Appropriations Subcommittees on either Agriculture or Labor/HHS did not receive major contributions from Big Agriculture or Food donors (measured by reference to the top 20 donors to each Member).
- All but one Republican on the House Agriculture Appropriations Committee signed onto the letter criticizing the DGAC report that was being promoted by food and meat industry interests, according to the letter's lead sponsor.

Both Houses of Congress

- Across both chambers and parties, total money from food interests to members of the Appropriations committees was at least \$1,464,437.
- To all signatories on both of the Congressional letters we examined criticizing the 2015 DGAC report, the food industry donated \$3,121,362 from 2013 through 2014.

Sources

Appendix B provides a more detailed breakdown of contributions to each committee and signatory by Senator or Member of Congress, sourced from data collected by The Center for Responsive Politics on the largest 20 donors to each member. The Center for Responsive Politics is a nonprofit organization that sources campaign finance data from the Federal Election Commission and reports on contributions to candidates and politicians, among other sources. The organizations listed did not themselves donate to the politicians listed; the contributions came directly from the organizations' political action committees (PACs), their individual members or employees or owners, and those individuals' immediate families. It is likely that our estimated totals are underestimates, as we used the Center for Responsive Politics' reports for only the top 20 donors to each Representative or Senator.

**Summary of Campaign Finance Contributions from
Food and Related Sectors:**

	Contributions from Food Industry 2013-2014
House Appropriations Subcommittee on Agriculture (harmful rider proposed in subcommittee)	To Republicans: \$231,800 To Democrats: \$37,600 Total: \$269,400
House Appropriations Subcommittee on Labor/HHS (harmful rider proposed in subcommittee)	To Republicans: \$276,542 To Democrats: \$10,000 Total: \$286,542
House Appropriations Full Committee (voting on riders)	To Republicans: \$685,942 To Democrats: \$142,650 Total: \$828,592
Senate Appropriations Subcommittee on Agriculture (harmful rider proposed in subcommittee)	To Republicans: \$230,200 To Democrats: \$15,000 Total: \$245,200
Senate Appropriations Subcommittee on Labor/HHS (harmful rider proposed in subcommittee)	To Republicans: \$427,426 To Democrats: \$15,000 Total: \$442,426
Senate Appropriations Full Committee (will vote on rider)	To Republicans: \$620,845 To Democrats: \$15,000 Total: \$635,845
Signatories to House of Representatives March 2015 Letter Criticizing the DGAC Report (all Republican)	Total: \$ 2,065,823
Signatories to the Senate March 2015 Letter Criticizing the DGAC Report (all Republican)	Total \$1,055,539

Appendix A: Congressional Interference in Health-Promoting Policies

Damage to Public Health Priorities Inflicted by Appropriations Riders

An Anti-Science Attack on the DGA 2015

The Dietary Guidelines for Americans (DGA) is updated and published by the United States Departments of Agriculture (USDA) and Health and Human Services (HHS) every five years. It provides science-based advice on diet and fitness to Americans and is the basis for nutrition policy and programs affecting millions of Americans. The most recent DGA was released in 2010, and a Committee of independent experts (the Dietary Guidelines Advisory Committee or DGAC) released a report in February 2015 providing recommendations that will serve as the basis for the 2015 DGA.

Both the Agriculture and Labor/HHS appropriations bills currently being considered in the House of Representatives contain a rider that would limit the 2015 Guidelines in two ways. First, any new recommendations or changes to the 2010 Guidelines must be based on conclusions rated “Grade 1: Strong” by the Nutrition Evidence Library (NEL) rubric. But the NEL rubric gives “strong” ratings only to conclusions reflecting nearly uniform results across many studies. For example, the mere presence of conflict, however explained it might be by study design, can be sufficient to downgrade a finding. This requirement is extremely limiting, inconsistent with common scientific practice, and would over-ride the expert and informed judgment of the government (and the experts on the DGAC) regarding the evidence.

It would exclude all but a handful of new recommendations in the 2015 DGAC Report. It also would create scientific inconsistency – many recommendations in the 2010 Guidelines were based on “Grade 2: Moderate” evidence, yet would be “grandfathered” into the 2015 Guidelines. The DGAC already scored all of its recommendations using this basic rubric and included a range of recommendations based on solid evidence that received lower than a Strong grade.

Second, new recommendations or changes could only be made concerning matters of diet and nutrient intake. This provision would exclude any advice based on new and developing science relating to exercise, food safety, or lifestyle changes, which are critical to preventing disease, achieving a healthy weight, and overall health. It also would exclude any new or modified policy advice, including recommendations relating to food security or food safety. Further, it would not allow new advice on ways to implement the health recommendations put forth in the rest of the Guidelines.

The Senate language in the Labor/HHS Appropriations bill is also troubling. It would restrict the recommendations to “only” conclusions supported by a “preponderance of the evidence.” And its limitations on the scope of advice are concerning, as they would limit the DGA to matters that are “solely” nutritional and dietary in nature. Moreover, it fails to mention the need for “medical knowledge,” which is essential to consideration of disease conditions that are diet-related.

These arbitrary limitations on scope or subject matter are unwarranted and threaten public health. Given that two-thirds of Americans are overweight or obese and half of Americans suffer from diet-related chronic disease, arbitrary restrictions on how to achieve the DGA’s common-sense

advice would be an enormous set-back. These limitations would amount to a political gag on the government's ability to provide the best science-based advice to the public; advice that has already been the subject of an extensive public consideration process. Given the diet-related health challenges facing millions of Americans, it is essential that an official government advice reflect up-to-date, science-based diet and fitness evidence.

Freezing Sodium Reductions in Schools at Current Levels

One in six American children has elevated blood pressure, which may escalate to high blood pressure in adulthood and lead to heart disease and stroke. Science supports the need for sodium reduction in children in order to accustom children to a less-salty diet and prevent or delay the onset of high blood pressure, heart disease, and stroke. The Dietary Guidelines Advisory Committee recently reaffirmed that the upper safe limit for sodium for kids should be 1,900–2,300 mg in a whole day. Ninety percent of children eat too much sodium (3,400 mg /day).

Sodium reduction in school meals is currently underway and being phased in. Schools are in the middle of phase 1, called Target 1, which sets a limit of no more than 1,360 mg of sodium in a middle-school lunch. The change to Target 2 will involve a further reduction of about 300 mg of sodium per meal for a middle-school lunch (equivalent to one-third of a dill pickle), a level of reduction that students are unlikely to notice, especially if reductions are made gradually.

The House Agriculture spending bill includes a rider that would freeze the school lunch program at the current sodium standards, preventing the next level of reduction due to take effect in 2017–2018 school year. Yet many food companies that sell to schools have already reformulated products to meet the Target 2 requirements, making the riders both pointless and harmful in schools that will need more incentives to comply.

Anti-Science House Appropriations Committee Report Language

While not binding on federal agencies, several portions of the House Appropriations Committee report language, according to news reports, are hostile to key public health advances.

Delaying Life-Saving Trans Fat Rules

Artificial trans fat forms when ordinary vegetable oil is hardened by treatment with hydrogen at high temperatures and pressures, and was widely used in margarine, shortening, and countless other processed foods. Until 1990, few studies had shown that trans fat might be harmful to health. But then in the early 1990s, careful, reliable clinical studies demonstrated that trans fat raises the “bad” LDL cholesterol, and lowers the “good” HDL cholesterol in blood, thereby increasing the risk of heart disease. Subsequent research found that trans fat also stiffens arteries and may increase the risk of diabetes.

In June 2015, the FDA finalized its determination that artificial trans fat is no longer generally recognized as safe for use in food. This long-expected move is a major victory for public health, and was the result of a sustained public health campaign that has included disclosing trans fat on

Nutrition Facts labels, litigation, and city, county, and state prohibitions on the use of partially hydrogenated oil in restaurants and bakeries.

Now, report language in the House Agriculture Appropriations bill (as reported by Politico after reporters obtained it) would ask FDA to re-analyze key issues in its PHO determination, forcing “the agency to clarify its position on a number of points, including that it did not declare that PHOs are ‘unsafe.’” The wording would also request more needless delay – requiring FDA to postpone enforcement of its decision until it gives permission for the food industry to include specified amounts of trans fat as a food additive.

Congress should not try to un-ring this bell. FDA has already declared PHOs unsafe based upon its expert evaluation, with ample time for public comment, of the robust scientific evidence of the harm from trans fat. Companies were certainly aware – or should have been aware – of the risk of continuing to use a substance documented to cost lives. FDA has also already provided a more-than-ample three-year compliance period for companies to abide by the change in rules – and companies will no doubt use this safe harbor and their pending food additive petition in any private litigation over trans fat.

Muddling the Science on Sodium and Forcing a Delay of FDA’s Long-Awaited Voluntary Guidance

The average American consumes about 3,500 mg of sodium daily, more than twice the daily limit recommended by the U.S. government for a majority of the adult population. According to the government’s 2010 Dietary Guidelines for Americans, adults should consume no more than 2,300 mg of sodium per day. For children, people with hypertension, adults 51 years and older, and African-Americans – a combined majority of Americans – the DGA recommends an even lower limit of 1,500 mg per day.

Reducing sodium intake remains one of the single best ways to prevent high blood pressure, heart attacks, and strokes. Researchers estimate that reducing current sodium consumption rates by 1,200 mg a day would eliminate 60,000 to 120,000 cases of coronary heart disease and save 44,000 to 92,000 lives per year. Such a shift in sodium consumption would also reduce medical costs by \$10 billion to \$24 billion annually.¹ Another study projected that a modest reduction in sodium intake of 4 percent per year would save 250,000 to 500,000 lives over the next 10 years.² Government data also estimated that 99 percent of those adults who are advised to further reduce sodium intake to 1,500 mg (*i.e.*, people aged 51 years and older, African-Americans, and those with hypertension) exceeded that recommended amount and consume, on average, 3,200 mg of sodium per day.³

¹ Bibbins-Domingo, Kirsten, *et al.* “Projected effect of dietary salt reductions on future cardiovascular disease.” *New England Journal of Medicine* 362(7) (2010): 590-599.

² Coxson PG, Cook NR, Joffres M, et al. Mortality benefits from US population-wide reduction in sodium consumption: projections from three modeling approaches. *Hypertension*. 2013; 61:564-70.

³ Cogswell ME, Zhang Z, Carriquiry AL, et al. Sodium and potassium intakes among US adults: NHANES 2003–2008. *Am J Clin Nutr*. 2012; 96:647-57.

In response to this substantial body of evidence, FDA is planning to propose voluntary guidance for sodium reductions by categories of foods. Such an approach could help considerably: in England, gradual reductions in the sodium content of processed foods from 2003 to 2011 resulted in a 15 percent decline in average sodium intake. Partly as a result, during that time systolic blood pressure dropped by 3 points, deaths from stroke dropped by 42 percent, and deaths from ischemic heart disease fell by 40 percent. Although other factors contributed to those declines, it is likely that the fall in sodium consumption played a significant role.⁴

In response, the food industry is threatening the effort with new roadblocks in Appropriations bills. The draft committee report language, written by the Republican majority, would direct FDA to coordinate with the Centers for Disease Control and Prevention (CDC) to convene yet another Institute of Medicine (IOM) panel on the issue and suggests no federal funding be spent on "reduction activities" below 3,000 mg per day until the science for healthy individuals is "formally considered."

Yet a prior report by IOM merely muddied the waters. A 2013 IOM report focused on limited evidence (only including studies published after 2003) and limited clinical outcomes. Some of the studies reviewed by the IOM have also been criticized for conflicts of interest or were retracted.⁵ A 2010 IOM report concluded that 40 years of voluntary efforts to lower sodium were totally ineffective and recommended that the FDA should set limits on sodium in various categories of food. FDA should press forward with its focus on the robust body of evidence linking sodium intake with elevated blood pressure as the American Heart Association, among other leading public health groups, have recommended.

Signatories to the House of Representatives’ March 2015 Letter Critical of the Dietary Guidelines for Americans Committee Report, 2015

According to a press release by the letter’s lead sponsor in the House, Rep. Vicky Hartzler (R.-MO), supporters of the letter included many of the major food trade associations, and particularly those with an interest in meat consumption: American Farm Bureau Federation, National Cattlemen’s Beef Association, National Pork Producer’s Council, National Restaurant Association, Livestock Marketing Association, North American Meat Institute, National Turkey Federation, and American Beverage Association.⁶
